

Baya Plus - Search Bar, Autocomplete, and Hero Slider Guide

1. Search Bar Filtering

Use JavaScript to listen for user input and filter displayed songs based on title or artist.

2. Hero Banner Auto-Slider

Create a slides array containing image paths, titles, artists, and release labels. Use `setInterval(changeSlide, 15000)` to switch content every 15 seconds. Apply CSS transitions for smooth fading.

3. Search Suggestions (Autocomplete)

Create a suggestion dropdown beneath the search box. As the user types, display matching songs, artists, or albums. Clicking a suggestion fills the search field.

4. Django Backend Integration

Use a Django view to receive the query parameter, search Song, Artist, and Album models, and return JSON results. JavaScript fetches `/search-suggestions/?q=query` and updates the dropdown dynamically.

5. Recommended Features

Search by song, artist, and album; autocomplete suggestions; hero slider with fade transitions; previous/next controls; hover pause; dynamic content loaded from Django models.
